Compound
~40%
Source-associated variance
875 measurements
348 compounds across 160 sources
2. Calibrate a held-out source
Other sources
Held-out source
Excluded from fitting
Fit QSPR model
Estimate offset
Add offset to test predictions
= Shared Anchor compound for calibration
= Test compound absent from training
3. Benefits and limits
One-anchor calibration
Reduced error in 24/38 sources
Five-anchor calibration
Reduced error further in 11/13 sources
More anchors can make an unsuitable correction more consistent.
